# 150mA Low-Noise LDO in SC-82 Without A Bypass Capacitor

## DESCRIPTION

The EUP7914 is an efficient CMOS low dropout (LDO) voltage regulator optimized for ultra-low-noise applications. It offers high output accuracy, extremely low dropout voltage, low ground current and fast start-up time. The EUP7914 provides a very low noise output without a bypass capacitor, ideal for RF applications where a clean supply voltage source is required. Specifically designed for handheld and battery-powered devices, the EUP7914 provides a TTL-logic-compatible enable pin. When the EUP7914 is disabled, power consumption drops nearly to zero. Key features include current limit, thermal shutdown and faster transient response.

The EUP7914 works with low-ESR ceramic capacitors. Available in the SC-82 space saving package which reduces the amount of board space for power applications. The EUP7914 offers wide fixed output voltage versions.

## Application Note

### Input Capacitor

An input capacitance of 1 $\mu$ F or higher is required between the EUP7914 input pin IN and ground (the amount of the capacitance may be increased without limit). This capacitor must be located a distance of not more than 1cm from the input pin and returned to a clean analog ground. Any good quality ceramic, tantalum, or film capacitor may be used at the input. If a tantalum capacitor is used at the input, it must be guaranteed by the manufacturer to have a surge current rating sufficient for the application. There are no requirements for the ESR on the input capacitor, but tolerance and temperature coefficient must be considered when selecting the capacitor to ensure the capacitance will be 1 $\mu$ F over the entire operating temperature range.

### Output Capacitor

The EUP7914 is designed specifically to work with very small ceramic output capacitors. A ceramic capacitor (temperature characteristics X7R or X5R) in 1 $\mu$ F to 10 $\mu$ F range with 5m $\Omega$  to 500m $\Omega$  ESR range is suitable in the EUP7914 application circuit. The output capacitor must meet the requirement for minimum amount of capacitance to maintain good loop stability and phase margin. See the table below.

Output Voltage	Output Capacitor Minimum Value
1.2~1.45	2.2 $\mu$ F
1.5~3.6	1 $\mu$ F

### No-Load Stability

The EUP7914 is stable without any external load. This is specially important for CMOS RAM keep-alive applications.

### On/Off Input Operation

The EUP7914 is turned off by pulling the EN pin low, and turned on by pulling it high. If this pin is floating, the regulator will always be on. To assure proper operation, the signal source used to drive the V<sub>EN</sub> input must be able to swing above and below the specified turn-on/off voltage thresholds listed in the Electrical Characteristics. When EN is logic low, output is internally discharged to GND through a 500 resistor.
