

M48Z512A M48Z512AY, M48Z512AV

4 Mbit (512 Kbit x 8) ZEROPOWER® SRAM

Features

- Integrated, ultra low power SRAM, power-fail control circuit, and battery
- Conventional SRAM operation; unlimited WRITE cycles
- 10 years of data retention in the absence of power
- Automatic power-fail chip deselect and WRITE protection
- Two WRITE Protect voltages: (V_{PFD} = power-fail deselect voltage)
 - M48Z512A:
 $V_{CC} = 4.75$ to $5.5V$, $4.5V \leq V_{PFD} \leq 4.75V$
 - M48Z512AY:
 $V_{CC} = 4.5$ to $5.5V$, $4.2V \leq V_{PFD} \leq 4.5V$
 - M48Z512AV:
 $V_{CC} = 3.0$ to $3.6V$, $2.8V \leq V_{PFD} \leq 3.0V$
- Battery internally isolated until power is applied
- Pin and function compatible with JEDEC standard 512K x 8 SRAMs
- SOIC package provides direct connection for a SNAPHAT top which contains the battery
- SNAPHAT housing (battery) is replaceable
- Equivalent Surface-Mount (SMT) solution requires a 28-pin M40Z300/W and a stand-alone 128K x8 LPSRAM (SNAPHAT® top to be ordered separately)
- PMDIP32 is an ECOPACK package

Description

The M48Z512A/Y/V ZEROPOWER® RAM is a non-volatile, 4,194,304-bit Static RAM organized as 524,288 words by 8 bits. The devices combine an internal lithium battery, a CMOS SRAM and a control circuit in a plastic, 32-pin DIP Module.

For Surface-Mount environments ST provides an equivalent SMT solution consisting of a 28-pin, 330mil SOIC NVRAM Supervisor (M40Z300/W) and a 32-pin, (Type II TSOP, 10 x 20mm) 4Mb LPSRAM. Both 5V and 3V versions are available (see [Table 2 on page 7](#)).

The unique design allows the SNAPHAT® battery package to be mounted on top of the SOIC package after the completion of the surface-mount process. Insertion of the SNAPHAT housing after reflow prevents potential battery damage due to the high temperatures required for device surface-mounting. The SNAPHAT housing is keyed to prevent reverse insertion.

The SNAPHAT battery package is shipped separately in plastic anti-static tubes or in Tape & Reel form. The part number is "M4Z32-BR00SH1."

2 Operating modes

The M48Z512A/Y/V also has its own Power-fail Detect circuit. The control circuitry constantly monitors the single V_{CC} supply for an out of tolerance condition. When V_{CC} is out of tolerance, the circuit WRITE protects the SRAM, providing a high degree of data security in the midst of unpredictable system operation brought on by low V_{CC} . As V_{CC} falls below the switchover voltage (V_{SO}), the control circuitry connects the battery which maintains data until valid power returns.

The ZEROPOWER[®] RAM replaces industry standard SRAMs. It provides the nonvolatility of PROMs without any requirement for special WRITE timing or limitations on the number of WRITES that can be performed.

2. $X = V_{IH}$ or V_{IL} ; V_{SO} = battery back-up switchover voltage.

2.1 READ mode

The M48Z512A/Y/V is in the READ mode whenever \bar{W} (WRITE Enable) is high and \bar{E} (Chip Enable) is low. The device architecture allows ripple-through access of data from eight of 4,194,304 locations in the static storage array. Thus, the unique address specified by the 19 Address Inputs defines which one of the 524,288 bytes of data is to be accessed. Valid data will be available at the Data I/O pins within Address Access time (t_{AVQV}) after the last address input signal is stable, providing that the \bar{E} (Chip Enable) and \bar{G} (Output Enable) access times are also satisfied. If the \bar{E} and \bar{G} access times are not met, valid data will be available after the later of Chip Enable Access time (t_{ELQV}) or Output Enable Access Time (t_{GLQV}). The state of the eight three-state Data I/O signals is controlled by \bar{E} and \bar{G} . If the outputs are activated before t_{AVQV} , the data lines will be driven to an indeterminate state until t_{AVQV} . If the Address Inputs are changed while \bar{E} and \bar{G} remain low, output data will remain valid for Output Data Hold time (t_{AXQX}) but will go indeterminate until the next Address Access.

1. Valid for Ambient Operating Temperature: T_A = 0 to 70°C or -40 to 85°C; V_{CC} = 4.75 to 5.5V, 4.5 to 5.5V, or 3.0 to 3.6V (except where noted).

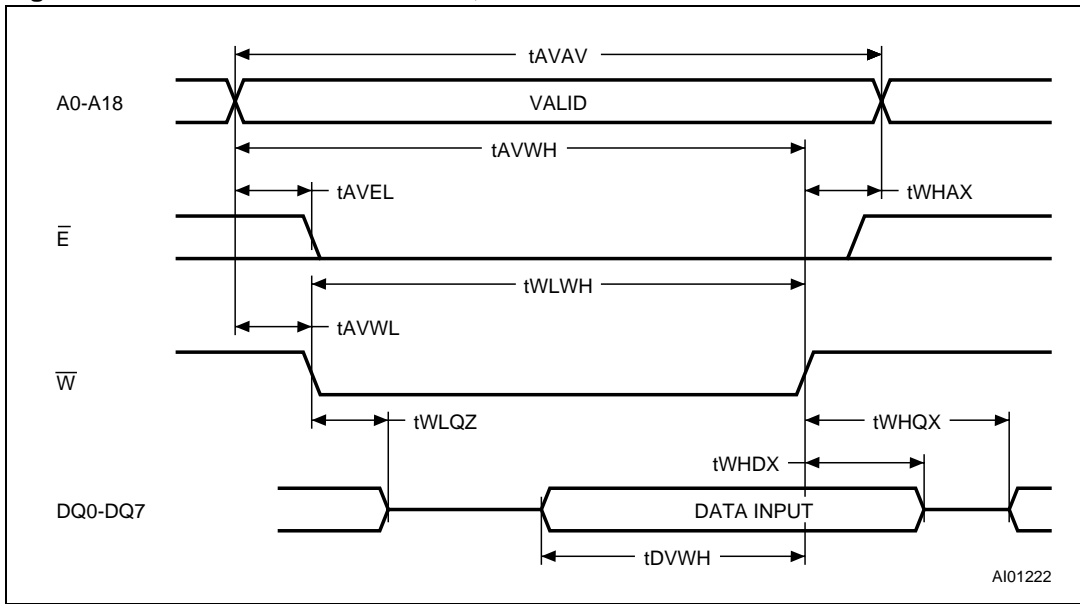

2. C_L = 5pF.

2.2 WRITE mode

The M48Z512A/Y/V is in the WRITE mode whenever \overline{W} and \overline{E} are active. The start of a WRITE is referenced from the latter occurring falling edge of \overline{W} or \overline{E} . A WRITE is terminated by the earlier rising edge of \overline{W} or \overline{E} .

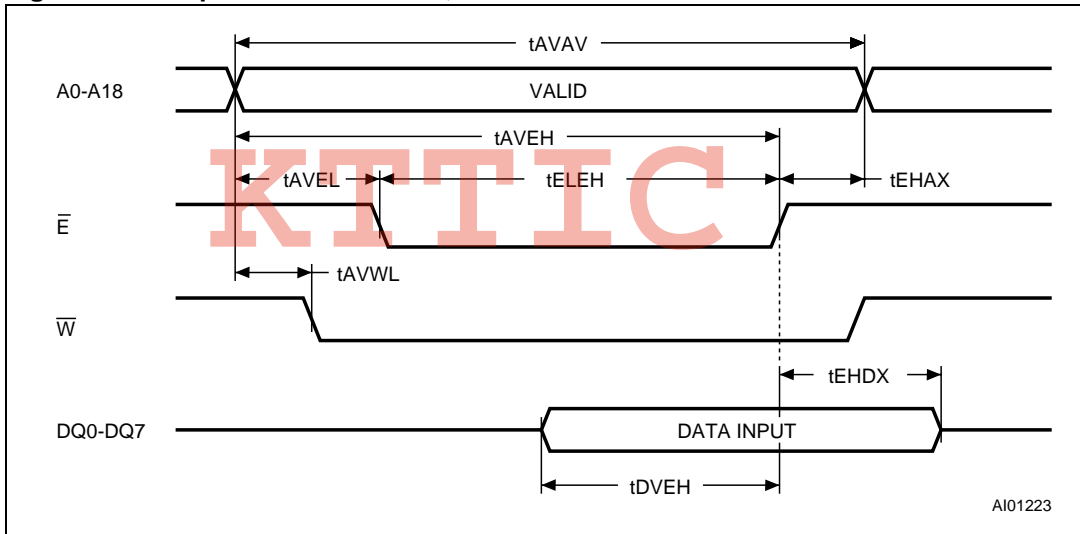

The addresses must be held valid throughout the cycle. \overline{E} or \overline{W} must return high for a minimum of t_{EHAX} from \overline{E} or t_{WHAX} from \overline{W} prior to the initiation of another READ or WRITE cycle. Data-in must be valid t_{DVEH} or t_{DVWH} prior to the end of WRITE and remain valid for t_{EHDx} or t_{WHDx} afterward. \overline{G} should be kept high during WRITE cycles to avoid bus contention; although, if the output bus has been activated by a low on \overline{E} and \overline{G} , a low on \overline{W} will disable the outputs t_{WLQZ} after \overline{W} falls.

- Valid for Ambient Operating Temperature: T_A = 0 to 70°C or -40 to 85°C; V_{CC} = 4.75 to 5.5V, 4.5 to 5.5V or 3.0 to 3.6V (except where noted).
- C_L = 5pF.
- If \bar{E} goes low simultaneously with \bar{W} going low, the outputs remain in the high impedance state.

2.3 Data Retention mode

With valid V_{CC} applied, the M48Z512A/Y/V operates as a conventional BYTEWIDE™ static RAM. Should the supply voltage decay, the RAM will automatically power-fail deselect, WRITE protecting itself t_{WP} after V_{CC} falls below V_{PFD}. All outputs become high impedance, and all inputs are treated as “don't care.”

If power fail detection occurs during a valid access, the memory cycle continues to completion. If the memory cycle fails to terminate within the time t_{WP} WRITE protection takes place. When V_{CC} drops below V_{SO}, the control circuit switches power to the internal energy source which preserves data.

The internal coin cell will maintain data in the M48Z512A/Y/V after the initial application of V_{CC} for an accumulated period of at least 10 years when V_{CC} is less than V_{SO}. As system power returns and V_{CC} rises above V_{SO}, the battery is disconnected, and the power supply is switched to external V_{CC}. WRITE protection continues for t_{ER} after V_{CC} reaches V_{PFD} to allow for processor stabilization. After t_{ER}, normal RAM operation can resume.

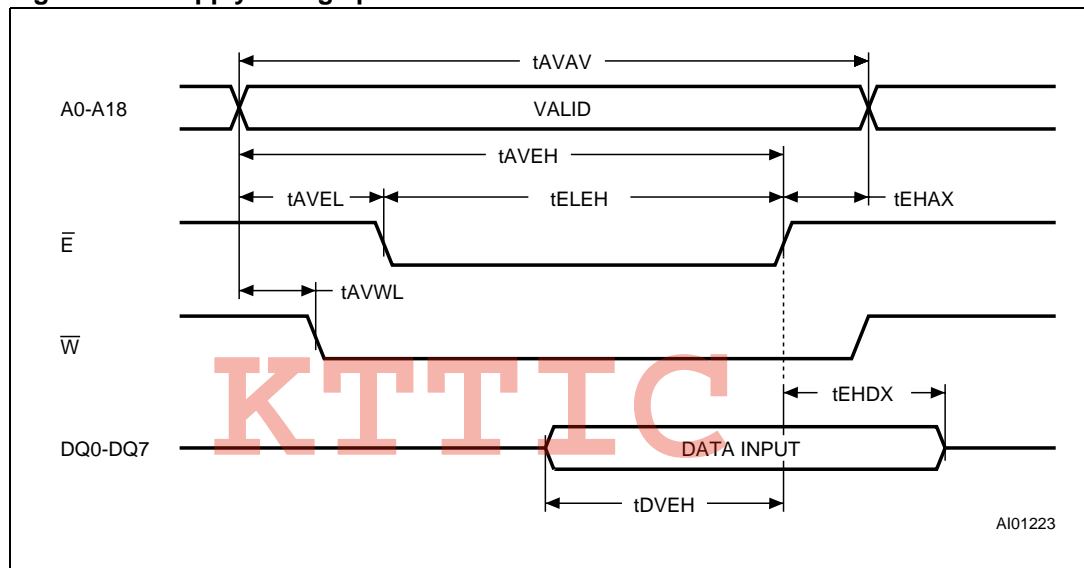

For more information on battery storage life refer to the Application Note AN1012.

2.4 V_{CC} noise and negative going transients

I_{CC} transients, including those produced by output switching, can produce voltage fluctuations, resulting in spikes on the V_{CC} bus. These transients can be reduced if capacitors are used to store energy which stabilizes the V_{CC} bus. The energy stored in the bypass capacitors will be released as low going spikes are generated or energy will be absorbed when overshoots occur. A ceramic bypass capacitor value of $0.1\mu\text{F}$ (see [Figure 9](#)) is recommended in order to provide the needed filtering.

In addition to transients that are caused by normal SRAM operation, power cycling can generate negative voltage spikes on V_{CC} that drive it to values below V_{SS} by as much as one volt. These negative spikes can cause data corruption in the SRAM while in battery backup mode. To protect from these voltage spikes, ST recommends connecting a schottky diode from V_{CC} to V_{SS} (cathode connected to V_{CC} , anode to V_{SS}). (Schottky diode 1N5817 is recommended for through hole and MBR5120T3 is recommended for surface-mount).

3 Maximum rating

Stressing the device above the rating listed in the “Absolute Maximum Ratings” table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

		M48Z512AV	-0.3 to 4.6	V
I _O	Output current	20	mA	
P _D	Power dissipation	1	W	

1. For DIP package: soldering temperature not to exceed 260°C for 10 seconds (total thermal budget not to exceed 150°C for longer than 30 seconds). No preheating above 150°C, or direct exposure to IR reflow (or IR preheat) allowed, to avoid damaging the Lithium battery.
2. For SO package, Lead-free (Pb-free) lead finish: Reflow at peak temperature of 260°C (total thermal budget not to exceed 245°C for greater than 30 seconds).

Caution: *Negative undershoots below -0.3V are not allowed on any pin while in the battery back-up mode. Do NOT wave solder SOIC to avoid damaging SNAPHAT sockets.*

4 DC and ac parameters

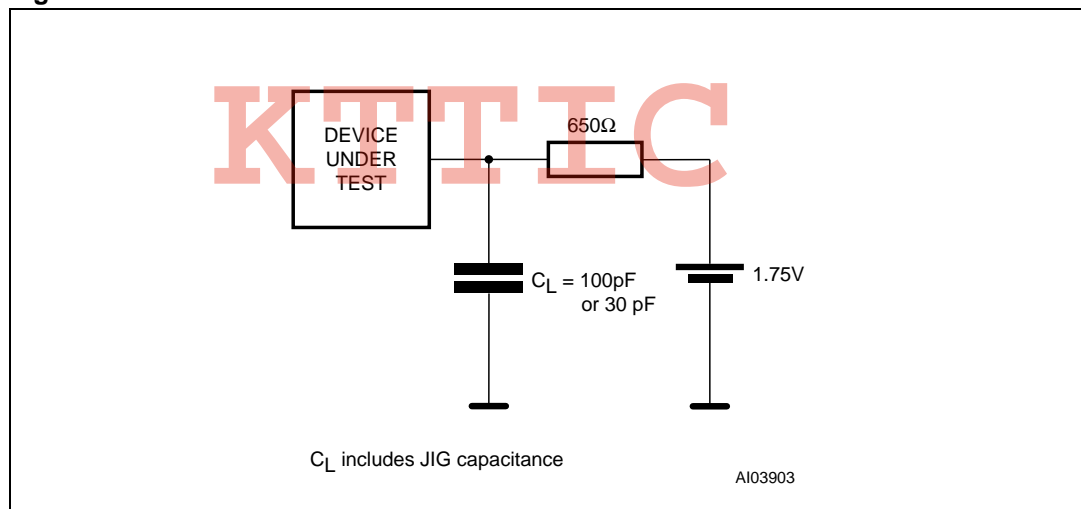

This section summarizes the operating and measurement conditions, as well as the dc and ac characteristics of the device. The parameters in the following dc and ac characteristic tables are derived from tests performed under the measurement conditions listed in the relevant tables. Designers should check that the operating conditions in their projects match the measurement conditions when using the quoted parameters.

Device type					
M48Z					
Supply voltage and WRITE Protect voltage					
512A = $V_{CC} = 4.75$ to $5.5V$; $V_{PFD} = 4.5$ to $4.75V$					
512AY = $V_{CC} = 4.5$ to $5.5V$; $V_{PFD} = 4.2$ to $4.5V$					
512AV = $V_{CC} = 3.0$ to $3.6V$; $V_{PFD} = 2.8$ to $3.0V$					
Speed					
-70 = 70ns (for M48Z512A/Y)					
-85 = 85ns (for M48Z512A/Y/V)

PM = PMDIP32					
Temperature range					
1 = 0 to 70°C					
6 = -40 to 85°C					

1. The SOIC package (SOH28) requires the battery package (SNAPHAT[®]) which is ordered separately under the part number "M4Zxx-BR00SH" in plastic tube or "M4Zxx-BR00SHTR" in Tape & Reel form.

Caution: Do not place the SNAPHAT battery package "M4Zxx-BR00SH" in conductive foam as it will drain the lithium button-cell battery.

For other options, or for more information on any aspect of this device, please contact the ST Sales Office nearest you.

7 Revision history

Table 18. Revision history

Date	Version	Revision Details
March 2000	1.0	First issue
19-Jul-00	1.1	M48Z12AV added
15-Jan-01	1.2	Changed LPSRAM device (Table 2)
19-Dec-01	2.0	Reformatted; added temperature information (Table 4 , Table 5 , Table 8 , Table 9 , Table 10 , and Table 11); remove chipset option from Ordering Information (Table 16); remove reference to “clock”
08-Feb-02	2.1	Remove 85ns speed grade (Table 4 , Table 5 , and Table 9)
29-May-02	2.2	Modify reflow time and temperature footnotes (Table 6)
18-Nov-02	2.3	Modified SMT text (Figure 1 , Figure 4 , and Table 2)
17-Sep-03	2.4	Remove references to M68xxx (obsolete) part (Figure 4 and Table 2); update disclaimer
30-Nov-04	3.0	Reformatted; remove extended temperature references (Table 16)
21-Dec-04	4.0	Update Marketing Status for qualification, correct drawing (Figure 4 and Table 16)
22-Feb-05	5.0	IR reflow, SO package updates (Table 6)
21-Dec-2006	6	Document reformatted. ECOPACK package text added on coverpage. Note 2 concerning Leaded SOIC package removed below Table 6 . Updated PMDIP32 package mechanical data in Section 5: Package mechanical information ; updated T _A to include Grade 1 (0 to 70°C) and Grade 6 (-40 to 85°C).
