Description

The Harris CD74HC147and CD74HCT147 are high speed silicon-gate CMOS devices and are pin-compatible with low power Schottky TTL (LSTTL).

The CD74HC147 and CD74HCT147 9-input priority encoders accept data from nine active LOW inputs ($\overline{I}_1$ to $\overline{I}_9$) and provide binary representation on the four active LOW inputs ($\overline{Y0}$ to $\overline{Y3}$). A priority is assigned to each input so that when two or more inputs are simultaneously active, the input with the highest priority is represented on the output, with input line $\overline{I}_9$ having the highest priority.

These devices provide the 10-line to 4-line priority encoding function by use of the implied decimal “zero”. The “zero” is encoded when all nine data inputs are HIGH, forcing all four outputs HIGH.
